Abstract: In this paper, He’s homotopy perturbation method is applied to nonlinear fifth order KdV equation. The procedure of the method is systematically illustrated. The results reveal that the proposed method is very effective and simple for obtaining approximate solutions of nonlinear partial differential equations.

Key words: Fifth order KdV equation • Homotopy perturbation method

INTRODUCTION

During the past decades, both mathematicians and physicists have devoted considerable effort to the study of exact and numerical solutions of the nonlinear ordinary or partial differential equations corresponding to the nonlinear problems. Many powerful methods have been presented. The homotopy perturbation method, proposed first by He in 1998 and was further developed and improved by He [1-5]. The application of the homotopy perturbation method (HPM) in nonlinear problems has been devoted by scientists and engineers, because this method is to continuously deform a simple problem which is easy to solve into the under study problem which is difficult to solve. It can be said that He’s homotopy perturbation method is a universal one, is able to solve various kinds of nonlinear functional equations. In this method the solution is considered as the summation of an infinite series which usually converges rapidly to the exact solutions.

For the purpose of applications illustration of the methodology of the proposed method, using homotopy perturbation method, we consider the following nonlinear differential equation,

\[ A(u) + f(r) = 0, \]  \hspace{1cm} (1)

\[ B(u, \partial u / \partial n) = 0, \]  \hspace{1cm} (2)

Where \( A \) is a general differential operator, \( f(r) \) is a known analytic function, \( B \) is a boundary condition and \( \Gamma \) is the boundary of the domain \( \Omega \).

The operator \( A \) can be generally divided into two operators, \( L \) and \( N \) where \( L \) is a linear, while \( N \) is a nonlinear operator. Equation (1) can be, therefore, written as follows:

\[ \frac{\partial u}{\partial t} + 15u^2 \frac{\partial u}{\partial x} - 15u \frac{\partial^2 u}{\partial x^2} - 15u^3 \frac{\partial^3 u}{\partial x^3} + \frac{\partial^5 u}{\partial x^5} = 0, \]  \hspace{1cm} (10)

With initial condition,

Using the homotopy technique, we construct a homotopy \( \chi(r,p) : \Omega \to [0,1] \to \mathbb{R} \) which satisfies:

\[ H(U, p) = (1-p)[L(U) - L(u_0)] + p[A(U) - f(r)] = 0, \hspace{1cm} p \in [0,1], \hspace{1cm} r \in \Omega \]  \hspace{1cm} (4)

\[ H(U, p) = L(U) - L(u_0) + pL(u_0) + p[N(U) - f(r)] = 0 \]  \hspace{1cm} (5)

Where \( p \in [0,1] \) is called homotopy parameter and \( u_0 \) is an initial approximation for the solution of Eq.(1), which satisfies the boundary conditions. Obviously from Eq. (4) and (5) we will have.

\[ H(U, 0) - L(U) - L(u_0) = 0, \]  \hspace{1cm} (6)

\[ H(U, 1) = A(U) - f(r) = 0, \]  \hspace{1cm} (7)

We can assume that the solution of (4) or (5) can be expressed as a series in \( p \), as follows:

\[ U = u_0 + pU_1 + p^2U_2 + ... \]  \hspace{1cm} (8)

Setting \( p = 1 \), results in the approximate solution of Eq. (1)

\[ u = \lim_{p \to 1} U = U_2 + U_3 + ... \]  \hspace{1cm} (9)

HPM for Fifth Order KdV Equation: The Korteweg-de Vries (KdV) equation, given here in canonical form, [6]

\[ \frac{\partial u}{\partial t} + 45u^2 \frac{\partial u}{\partial x} - 15 \frac{\partial^2 u}{\partial x^2} + 15u \frac{\partial^3 u}{\partial x^3} + \frac{\partial^5 u}{\partial x^5} = 0, \]  \hspace{1cm} (10)

Corresponding Author: E. Alibeigi, Islamic Azad University of Gonbad Kavoos Branch, Iran
\( u(x,0) = a_0 - 2c_2 \sec h^2(\sqrt{c_1}x) \) \hspace{1cm} (11)

and the exact solution

\[
\begin{align*}
    u = & \quad a_0 - 2c_2 \sec h^2(\sqrt{c_1}x - (45a_0^2 - 60c_0c_2 + 16c_2^3x)), \\
    & \quad c_2 > 0.
\end{align*}
\]

Where \( a_0, c_2 \) are arbitrary constants.

To solve Eq. (10) by homotopy perturbation method, we construct the following homotopy.

\[
(1 - p) \left( \frac{\partial U}{\partial t} - \frac{\partial u}{\partial t} \right) + p \left( \frac{\partial U}{\partial t} + 45U^2 \frac{\partial U}{\partial x} \right) - 15 \frac{\partial U}{\partial x} \frac{\partial^2 U}{\partial x^2} - 15U \frac{\partial^2 U}{\partial x^2} + \frac{\partial^3 U}{\partial x^3} = 0,
\]

or

\[
\frac{\partial U}{\partial t} - \frac{\partial u}{\partial t} + p \left( \frac{\partial u}{\partial t} + 45U^2 \frac{\partial U}{\partial x} \right) - 15 \frac{\partial U}{\partial x} \frac{\partial^2 U}{\partial x^2} - 15U \frac{\partial^2 U}{\partial x^2} + \frac{\partial^3 U}{\partial x^3} = 0, \hspace{1cm} (12)
\]

Suppose the solution of Eq. (12) has the following form

\[
U = U_0 + pU_1 + p^2U_2 \hspace{1cm} (13)
\]

Substituting (13) into (12) and equating the coefficients of the terms with the identical powers of \( p \) leads to

\[
\begin{align*}
    p^0 : & \quad \frac{\partial U_0}{\partial t} - \frac{\partial u_0}{\partial t} = 0, \\
    p^1 : & \quad \frac{\partial U_1}{\partial t} + 45U_0^2 \frac{\partial U_0}{\partial x} - 15 \frac{\partial U_0}{\partial x} \frac{\partial^2 U_0}{\partial x^2} - 15U_0 \frac{\partial^2 U_0}{\partial x^2} + \frac{\partial^3 U_0}{\partial x^3} = 0, \\
    & \quad -15 \frac{\partial U_1}{\partial x} + 45U_0 \frac{\partial U_1}{\partial x} - 15 \frac{\partial U_1}{\partial x} \frac{\partial^2 U_1}{\partial x^2} - 15U_0 \frac{\partial^2 U_1}{\partial x^2} + \frac{\partial^3 U_1}{\partial x^3} = 0, \\
    & \quad \vdots
\end{align*}
\]

We take

\[
U_0 = u_0 = a_0 - 2c_2 \sec h^2(\sqrt{c_1}x). \hspace{1cm} (14)
\]

We have the following recurrent equations for \( j = 1, 2, 3, \ldots \)

\[
U_j = \frac{\partial U_j}{\partial t} + 45 \sum_{i=0}^{j} \sum_{k=0}^{i-k} U_i U_k \frac{\partial U_j}{\partial x} - 15 \sum_{i=0}^{j} \frac{\partial U_k}{\partial x} \frac{\partial^2 U_j}{\partial x^2} - 15 \sum_{i=0}^{j} U_k \frac{\partial^2 U_j}{\partial x^2} + \frac{\partial^3 U_j}{\partial x^3} = 0, \hspace{1cm} (15)
\]

With the aid of the initial approximation given by Eq. (14) and the iteration formula (15) we get the other component as follows:

\[
\begin{align*}
    U_1 = & \quad 720\alpha_0 \sqrt{c_1} \sec h^2(\sqrt{c_1}x) \tanh^2(\sqrt{c_1}x) - 480\alpha_0 \sqrt{c_1} \sec h^2(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) - 216\alpha_0 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) + 1200 \alpha_0 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) - 180 \alpha_0 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^2(\sqrt{c_1}x) a_0^2 + 720 \alpha_0 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) a_0^2 - 720 \alpha_0 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) a_0^2 - 1440 \alpha_0 \sqrt{c_1} \sec h^2(\sqrt{c_1}x) \tanh^2(\sqrt{c_1}x) a_0^2 + 1920 \alpha_0 \sqrt{c_1} \sec h^2(\sqrt{c_1}x) \tanh^2(\sqrt{c_1}x) a_0^2 - 544 \alpha_0 \sqrt{c_1} \sec h^2(\sqrt{c_1}x) \tanh(\sqrt{c_1}x) a_0^2, \\
    U_2 = & \quad 353792 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) + 162000 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^2(\sqrt{c_1}x) a_0^2 + 238080 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 - 4348080 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 - 74606400 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 - 130894880 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 + 85680 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 + 156470400 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 + 5702400 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2 - 9504000 \alpha_0^2 \sqrt{c_1} \sec h^3(\sqrt{c_1}x) \tanh^3(\sqrt{c_1}x) a_0^2
\end{align*}
